

Chapter 9 Node Js Drop Records

Node.js MySQL Drop Table

The DROP TABLE command is used to delete or drop a table.

Let's drop a table named employee2.

Create a js file named "delete" in DBexample folder and put the following data into it:

```
var mysql = require('mysql');
var con = mysql.createConnection({
  host: "localhost",
  user: "root",
  password: "12345",
  database: "webisoftech"
});
con.connect(function(err) {
  if (err) throw err;
  var sql = "DROP TABLE employee2";
  con.query(sql, function (err, result) {
    if (err) throw err;
    console.log("Table deleted");
  });
});
```

Now open command terminal and run the following command:

Node drop.js

Verify that the table employee2 is no more in the database.
